CARING FOR YOUR FITNESS EQUIPMENT
Best practices to keep your equipment in top shape if your fitness facility is closed

If your fitness facility is closed to members during these uncertain times, but you or your staff can still access the building, there are few things you can do to keep your equipment in good shape while it’s unused so that it’s ready for the day you reopen.

DURING CLOSURE

- Use the power switch to turn units off
- If you must unplug the units, be sure the power cable is not damaged in the process and is properly tied or stored while unplugged
- Avoid using the circuit breaker to turn equipment off (use the power switch or unplug first)
- Cover any units that may be exposed to excessive moisture or dust while it is unused

RESTORING EQUIPMENT FOR REOPENING

- Wipe down all the equipment before turning back on
- Check all power cables for damage before inserting back into outlets
- Test each unit individually before you reopen
- Address any damage caused by moving or storage
- Check for any new software releases and update before use
- Replace any batteries (such as those in Rower consoles) that no longer hold a charge after two weeks or test under 6.0 volts for Life Fitness equipment or 12 volts for Cybex equipment
